1 - Modules

List the modules this notebook is based on. Different sorting variations help finding modules by their features and support larger code bases where the list of all modules gets very long.

Only the top 30 entries are shown. The whole table can be found in the following CSV report: List all Typescript modules

2 - Cyclic Dependencies

Cyclic dependencies occur when one module uses an elements of another module and vice versa. These dependencies can lead to problems when one of these modules needs to be changed.

Table 2a - Cyclic Dependencies Overview

Show the top 40 cyclic dependencies sorted by the most promising to resolve first. This is done by calculating the number of forward dependencies (first cycle participant to second cycle participant) in relation to backward dependencies (second cycle participant back to first cycle participant). The higher

this rate (approaching 1), the easier it should be to resolve the cycle by focussing on the few backward dependencies.

Only the top 40 entries are shown. The whole table can be found in the following CSV report:

Cyclic_Dependencies_for_Typescript

Columns:

- projectFileName identifies the project of the first participant of the cycle
- modulePathName identifies the module of the first participant of the cycle
- dependentProjectFileName identifies the project of the second participant of the cycle
- dependentModulePathName identifies the module of the second participant of the cycle
- forwardToBackwardBalance is between 0 and 1. High for many forward and few backward dependencies.
- *numberForward* contains the number of dependencies from the first participant of the cycle to the second one
- numberBackward contains the number of dependencies from the second participant of the cycle back to the first one
- someForwardDependencies lists some forward dependencies in the text format "type1 -> type2"
- backwardDependencies lists the backward dependencies in the format "type1 <- type2" that are recommended to get resolved

| | projectFileName | moduleName | dependentProjectFileName | dependentModulePathName | forwardToBackwardBalance | numberForward | numberBackward | forwardDe |

Table 2b - Cyclic Dependencies Break Down

Lists modules with cyclic dependencies with every dependency in a separate row sorted by the most promising dependency first.

Only the top 40 entries are shown. The whole table can be found in the following CSV report: Cyclic Dependencies Breakdown for Typescript

Columns in addition to Table 2a:

dependency shows the cycle dependency in the text format "type1 -> type2" (forward) or "type2<-type1" (backward)

Table 2c - Cyclic Dependencies Break Down - Backward Dependencies Only

Lists modules with cyclic dependencies with every dependency in a separate row sorted by the most promising dependency first. This table only contains the backward dependencies from the second participant of the cycle back to the first one that are the most promising to resolve.

Only the top 40 entries are shown. The whole table can be found in the following CSV report: Cyclic_Dependencies_Breakdown_BackwardOnly_for_Typescript

Table 3c - Distance distribution between dependent files

This table shows the file directory distance distribution between dependent files. Intuitively, the distance is given by the fewest number of change directory commands needed to navigate between a file and a dependency it uses. Those are aggregate to see how many dependent files are in the same directory, how many are just one change directory command apart, and so on.

| | $dependency. file {\tt Distance As Fewest Change Directory Commands}$ | number Of Dependencies | number Of Dependency Users | number Of Dependency Providers | examples |
|---|---|------------------------|----------------------------|--------------------------------|---|
| 0 | 0 | 1 | 1 | 1 | [./server.tsx uses ./index.tsx] |
